WhatsApp If there's one feature that WhatsApp users are begging for, it's the ability to transfer data between Android and iPhone. After all, no one wants to be committed to one platform forever. Fortunately, WhatsApp has finally decided to allow transfers between iPhone and Android, though it'll only work on select phones at first. Samsung had its massive Galaxy Unpacked event where the company announced new foldable phones, earbuds, and watches. Mixed in with all of that excitement, Samsung announced that WhatsApp users would be able to transfer data from iPhones to either the Galaxy Z Fold 3 or the Galaxy Z Flip 3. Want to securely take your WhatsApp history from one platform to another? We're working to make this possible starting with @SamsungMobile devices, and it's coming to @Android and iOS phones soon. — Will Cathcart (@wcathcart) August 11, 2021 After the initial period of exclusivity for the new phones, Samsung also said that the transfer feature would come to other Samsung devices "in the coming weeks."

Following that, WhatsApp intends to bring the feature to other Android and iPhone devices, making it possible to transfer between any supported phone. This is an excellent feature for anyone thinking about switching operating systems. There are plenty of compelling reasons to choose between Android and iPhone, so being able to jump ship without losing your WhatsApp chat history and other data. Puzzling about transfer WhatsApp message from Android to iPhone? Follow this step by step.1. Open WhatsApp on your Android device, go "Setting>Chats Setting>Chat History>Email chat"2. Your Android WhatsApp messages will be transferred to your iPhone. Have you got this tips now?Though it's a little bit complicated, it is necessary to do it if you want to switch Phone between Android and iOS.More effective methods to Transfer WhatsApp Messages from Android to iPhone.If you want to do it in reverse direction, go transfer WhatsApp messages from iPhone to Android. Since it was founded in 2009, WhatsApp has become one of the apps you're most likely to find on phones worldwide. Today, it has over 2 billion users in 180 countries – even more than users of its stablemate, Facebook Messenger, which is presumably why Mark Zuckerberg's company were so keen to gobble it up for an eye-watering \$19 billion in 2014.A new privacy policy revealed in January 2021 has meant the app requires you to share certain personal details with Facebook to continue using the app.To use WhatsApp past February 8, 2021, you'll need to agree to the new terms that allow Facebook to see data including your phone number, status messages, profile names, IP address and more.Many are looking to switch to an alternative app to ensure they don't have to share this data with Facebook, and that's where this list comes in. Below we've listed a variety of the top alternatives you can switch to as an alternative to WhatsApp.WhatsApp vs Signal vs TelegramImage credit: Telegram (Image credit: Shutterstock/Telegram is perhaps WhatsApp's closest competitor in terms of functionality - and it even looks almost identical to the Facebook-owned behemoth. What sets it apart is that it doubles down on the promises over security: not only are messages end-to-end encrypted, but it is

possible to set messages to self-destruct after a given time - leaving no trace of whatever important conversations you're having. One other nice feature is that, unlike WhatsApp, it's truly multi-platform - with apps available for desktop, as well as mobile and on the web. Download Telegram for iPhone (opens in new tab) and Android (opens in new tab)Image credit: Signal (Image credit: Signal)SignalMany of these alternatives boast about their security credentials but if you're really paranoid there's only one option. Signal offers a similar suite of features to its competitors, as well as end-to-end encryption, but there's one big difference. The app itself is open-source. This means that all of the code for the app is publicly available to view, making it impossible for the creators to sneak in any backdoors that could give governments or hackers access to your messages. The app has also scored a major endorsement to bolster its privacy credentials even further in the form of NSA whistleblower Edward Snowden. Download Signal for iPhone (opens in new tab) and Android (opens in new tab)Image credit: AppleiMessageIn response to the growth of WhatsApp, Apple has built out its own Messages app - iMessage - to be just as fully featured. Now, when messaging iPhone to iPhone, there are no character limits, you can send pictures, videos and... well, pretty much anything, thanks to a plethora of app integrations. Most notably, this includes Apple Pay in some countries, so that you can literally send money over text and, of course, Animojis. Hit a button and rather than type out your missive, you can perform it as a 3D animal puppet, with the fox, monkey or unicorn's mouth movements matching your own. And yes, you can also be a talking poop emoji, but we recommend only using that when, say, dumping someone or telling a loved one about a death in the family. There's just one catch: iMessage is, by design, only available on Apple devices, so if you want to chat with your Android mates you've got to go back to using plain old 140-character SMS. You'll find iMessage already downloaded to your iPhoneImage credit: Google Google MessagesIn response to Apple not playing nicely with iMessage, Google launched its own Android-only messaging service called... Messages. Available on the Play Store, this app also replaces your standard SMS app, and the big point in its favor is that it deeply integrates with all of Google's apps and services. This means that you can easily share images from your Google Photos, or use Google Assistant to make a restaurant reservation with a friend from right within the app. Download Google Messages on Android (opens in new tab)Image credit: FacebookFacebook MessengerThis won't avoid the issue of sharing your data with Facebook, but it does pose a suitable alternative to WhatsApp for some. Facebook Messenger is an integral part of the Facebook experience, but a separate app enables private messaging between individuals and groups. You may find this is more suitable for you than WhatsApp, especially as it works separately from a phone number so you can use it across multiple devices at once without having to reauthorize the app. Download Facebook Messenger for iPhone (opens in new tab) and Android (opens in new tab)An example of Viber's disappearing messages (Image credit: Viber)Line, Viber, WeChat and othersThere are a number of other messaging apps out there which have millions of users. Line, for instance, reportedly had 700m registered users in 2019 and Viber supposedly had 260m active users every month then too. Some of these apps have some really interesting functionality too - for example, WeChat has an entire mini-app eco-system inside of the app, so that you can shop, order taxis and so on without leaving WeChat itself. But we wouldn't necessarily recommend making the switch to these apps as they may not be all that useful. Why? Because they're mere minnows in the English-speaking world. WeChat dominates China, Line is the go-to messenger in Japan, and BlackBerry Messenger is the biggest in Indonesia (no, really) - which are great if you live there. If you're in the UK, the United States, or Australia however, you're not going to find that many of your friends on these apps. Image credit: Shutterstock (Image credit: shutterstock)A good old-fashioned phone call Finally, we have one obscure option that we don't think many people will pick - but one that is worth mentioning. It's a little known fact that every phone has one app built in that is always running. Every user is given a unique ID number, which if entered by another person, will interrupt whatever else you're doing on your phone and force you to pay attention. It will even play a long, annoying sound to capture your attention. The "Telephone" app has its critics, but it is a technology dating back over a century, and is still a serviceable way to stay in touch with your loved ones. Who knows, maybe your mum would enjoy hearing your voice every once in a while? WhatsApp vs Signal vs Telegram Verizon's HTC Droid Incredible runs the Sense interface on top of Android OS 2.1. The Droid Incredible (\$200 with a two-year contract) features a 3.7-inch AMOLED touchscreen display, a fast 1GHz processor, an 8-megapixel camera, MicroSD-card expansion up to 32 gigabytes, multitasking, and the Friend Stream social network aggregator. The Droid Incredible lacks a physical keyboard. Its touchscreen provides the primary user interface; voice command is also an option for calls, search, and GPS navigation. For more information on this and the other phones shown here, check out our Top 10 Android Smartphones chart. Verizon's Motorola Droid features a slide-out keyboard, a 3.7-inch, 480-by-854-pixel touchscreen display, Android OS 2.1, MicroSD-card expansion up to 32 gigabytes, Wi-Fi and Bluetooth 2.1 support, a 5-megapixel camera, and hardware-accelerated graphics. The Droid (\$200 with a two-year contract) features an excellent and surprisingly fun voice-enabled search and GPS navigation capability. This makes the Droid stand out from older Android smartphone offerings. The T-Mobile Samsung Behold II has a brilliant 3.2-inch, 320-by-480-pixel AMOLED capacitive touchscreen display, a 5-megapixel camera, and TouchWiz 2.0, a touch-friendly user interface running over the now-outdated Android OS 1.5. Note: the newest Android Market apps may require Android OS 2.1 for full functionality. The first Android smartphone to run Android OS 2.1, the Google Nexus One boasts a brilliant 3.7-inch, 400-by-800-pixel AMOLED display, a fast 1GHz Snapdragon processor from Qualcomm, a 5-megapixel camera, and voice-powered navigation and search software. This phone is offered for direct purchase by Google for \$529, and also by T-Mobile for \$179 with a two-year contract. Reports of problems with poor network reception issues have reduced the appeal of this phone, and both Sprint and Verizon have decided to nix the Nexus One. The T-Mobile Motorola Cliq features a slide-out keyboard, a 3.1-inch, 320-by-480-pixel capacitive touch display, and the MotoBlur social network aggregator. The Cliq (\$150 with two-year contract) has Wi-Fi support, turn-by-turn GPS, a 5-megapixel camera, and a standard 3.5-mm headphone jack. It runs the now-dated Android OS 1.6, so don't expect some of the latest Android OS 2.1 apps to work. The Sprint Samsung Moment (\$100 with a two-year contract) features a slide-out keyboard, a 3.2-inch, 320-by-480-pixel AMOLED capacitive touchscreen display, a 3.32-megapixel camera, and Android OS 1.5. Prospective buyers should be aware that the Moment does not take advantage of the latest features to be found in Android OS 2.1. Sprint's HTC Hero (\$100 with a two-year contract) features a 3.2-inch, 480-by-320 capacitive touchscreen display with multitouch, pinch-to-zoom functionality. One of the biggest draws of the Hero is that it is the first Android handset to support Flash Lite 9. Unfortunately, video playback remains a mixed bag—many video sites still don't play properly. The HTC Hero has a 5-megapixel camera and a 3.5-mm headphone jack. It is becoming a little outdated with the release of newer Android smartphones like the EVO 4G, and its current price reflects that fact. The T-Mobile myTouch 3G (available for \$150 with a two-year contract) features a 3.2-inch, 320-by-480-resolution (HVGA) capacitive touchscreen display, a 3-megapixel camera, and Android OS 1.5. Note: Prospective buyers should be aware that the myTouch 3G does not take advantage of the latest features to be found in Android OS 2.1. The Verizon Motorola Devour (\$150 with a two-year contract) features a slide-out keyboard, a 3.1-inch touchscreen display, MicroSD-card expansion, a 3-megapixel camera, and the MotoBlur social network aggregator. The Devour is similar in appearance to the Droid, but has lower-spec hardware. The Devour runs the older Android OS 1.6, whereas the Droid runs Android 2.1, so some newer Android Market apps may not perform well. The HTC Droid Eris is offered by Verizon for \$80 with a two-year contract. Lacking a physical keyboard, the handset relies on a 3.2-inch, 480-by-320-pixel touchscreen for navigation. The Droid Eris has a 528MHz Qualcomm MSM 7600 CPU, a 5-megapixel camera, Wi-Fi, Bluetooth 2.0, and a GPS receiver. However, the phone runs the Android OS 1.5, which means that it can't take advantage of some of the most recent features available in Android OS 2.1. If that doesn't bother you, the Droid Eris should be a cheaper alternative to the Droid.
